PROFILE

Systems-oriented Software Engineer with a strong foundation in theoretical mathematics and computer architecture. Experienced in designing real-time data pipelines, low-level compilers, and networking protocols using C++, Python, and Rust. Entrepreneurial background scaling early-stage startup architecture. Eager to apply rigorous analytical problem-solving and clean code practices to high-performance, latency-sensitive environments.

EDUCATION

B.Sc. Industrial Mathematics (Mathematics & Computer Science) *Expected Graduation: 2028*
University of Lagos, Lagos, Nigeria
Core Coursework: Systems Programming · Numerical Analysis · Statistical Modeling · Algorithm Optimization · Linear Algebra

TECHNICAL SKILLS

Languages	C++ · Python · Rust · TypeScript · SQL
Systems & Architecture	Memory Management · Network Protocols (Scapy) · Compiler Design · Language Server Protocols (LSP) · Embedded Systems
Data & AI Pipelines	PyTorch · Pandas · NumPy · PostgreSQL · Real-time Data Routing
Tools & Environments	Linux R&D · Git · Node.js · React

PROFESSIONAL EXPERIENCE

Co-founder & Software Engineer | Lunix-dv *Jan 2026 – Present*

- Co-founded an early-stage tech startup, demonstrating an entrepreneurial drive and taking ownership of full-cycle product development from concept to deployment.
- Architected and shipped scalable frontend and backend infrastructure, optimizing for rapid user acquisition and low-latency interactions.
- Managed cross-functional community engagement, bridging the gap between technical feature development and active user feedback.

SYSTEMS & ENGINEERING PROJECTS

Goonsharp Compiler & LSP *Rust · C++*

- Engineered a cross-platform, performance-first programming language with a full compilation pipeline, demonstrating a deep understanding of underlying computer architecture and memory safety.
- Built a custom Language Server Protocol (LSP) from scratch to handle real-time code diagnostics and IDE-grade autocompletion.
- Optimized low-level system integration capabilities, strictly adhering to clean code and well-architected system principles.

NeuroSync Mesh Network *Python · Scapy · PyTorch · Linux*

- Developed a real-time, offline P2P data routing system to process and transmit live sensor data across decentralized hardware nodes without internet dependency.
- Leveraged Scapy for custom packet crafting and network manipulation, ensuring reliable, low-latency data transfer in constrained environments.
- Integrated PyTorch and SciPy for real-time signal processing of raw data feeds.

Real-Time Automated Alert Pipeline *Python · Node.js · PostgreSQL*

- Architected a high-throughput monitoring system that continuously processes voice patterns and triggers instant API-driven alerts via Twilio based on strict conditional logic.
- Optimized data flow between multiple cloud endpoints to reduce execution latency, ensuring real-time reliability for critical event dispatching.
